**FIDELITY AWARD 2024:**  
**Audio Physic Spark**

### Audio Physic Spark

Like all Audio Physic loudspeakers, the Spark, too, clearly exhibits the handiwork of the manufactory: evidently, a passionate team was at work here that approaches every aspect of the design from an unusual angle and often comes up with better results precisely because of that. This shows already in the enclosure design, which consists of a wood fiber based inner box to which the outer glass panels are elastically coupled – due to the very different resonance behavior of the two layers, this construction is particularly effective at mitigating vibration propagation. The driver technology used is equally unusual: The HHCM SL midrange, for instance, does without a spider, which consequently cannot reflect the back wave back at the diaphragm, thus avoiding the associated distortion. These are just two among countless innovative solutions, which in concert create the typical Audio Physic sound signature marked by agile musicality as well as stupendous soundstaging.

The driver complement is very much familiar – the same setup can be found in the manufacturer's large floorstanding models. "Lifted out" into a compact enclosure of their own, the drivers make it possible to experience the Audio Physic sound in smaller rooms.
